COFIROUTE
Tests on
Motorway

- Duration: 30 months
- Start : 1 September 2010
- Total Budget: 5.6 M€
- Support : 2.7 M€
- More than 20 Partners

Uses Cases

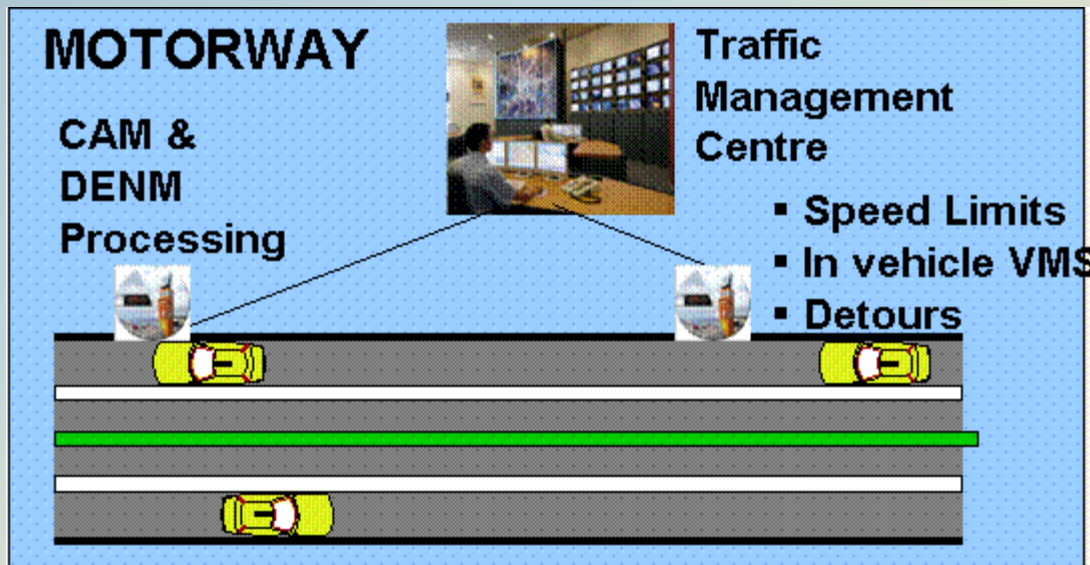

- Traffic Management
 - Collect of traffic information and centralization to the management center (GT01)
 - Legal and contextual speeds limits (GT02)
 - In-vehicle signage (MC01)
- Road Safety
 - Road works warning (SR01)
 - Information about obstacle on roads (SR04)
 - Information about humans on roads (SR05)
- Mobility and Comfort
 - Point of interest notification
 - Carpooling...

Uses Cases

- The tests focus on :
- Alert driver application
 - Collision risk warning
 - Traffic data exchange

Co-operative Awareness (V2V)
(Info to driver)

Longitudinal Collision Risk Warning

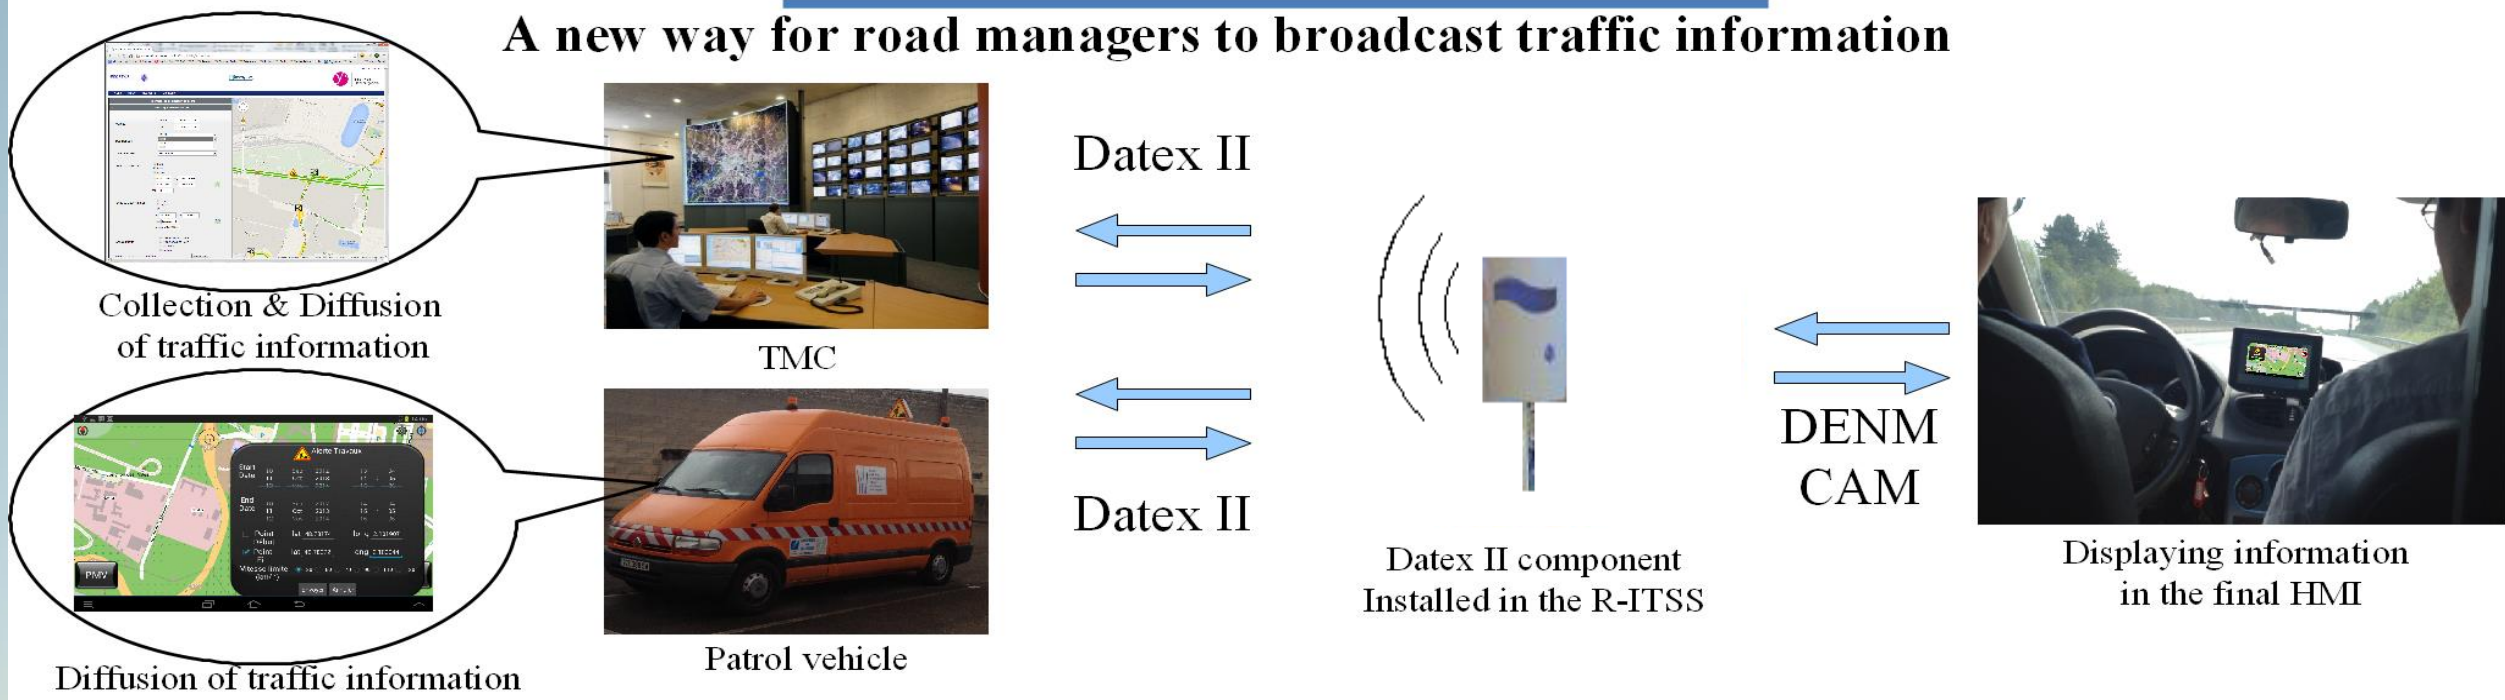

Intersection Collision Risk Warning

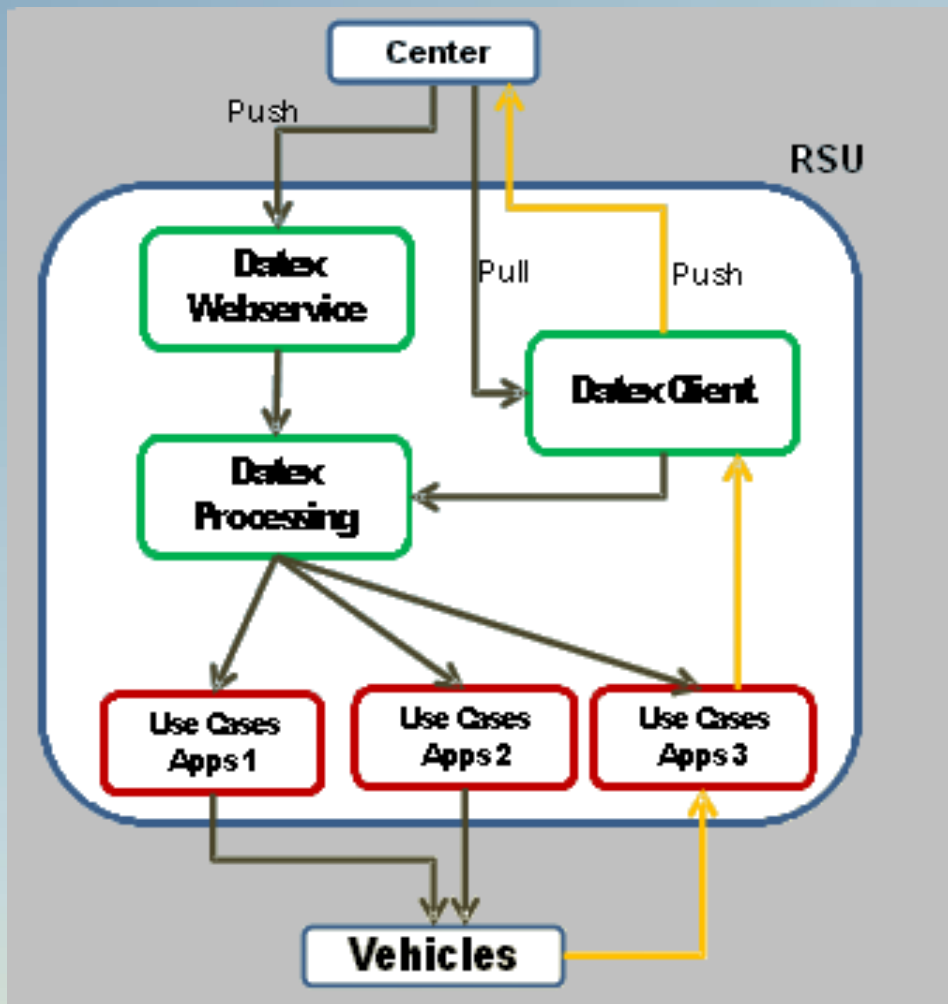

General Architecture

Information can come down from the manager center or a patrol, or up from vehicles.

A new way for road managers to broadcast traffic information

RSU's Internal Architecture

The architecture is in two Part : Datex II Gateway and The uses cases apps.

Datex Webservice: provides an Internet service that can receive message in Datex II format from the Road Mangement Center. (PCE in french). It forwards the message to the next bundle for traitement.

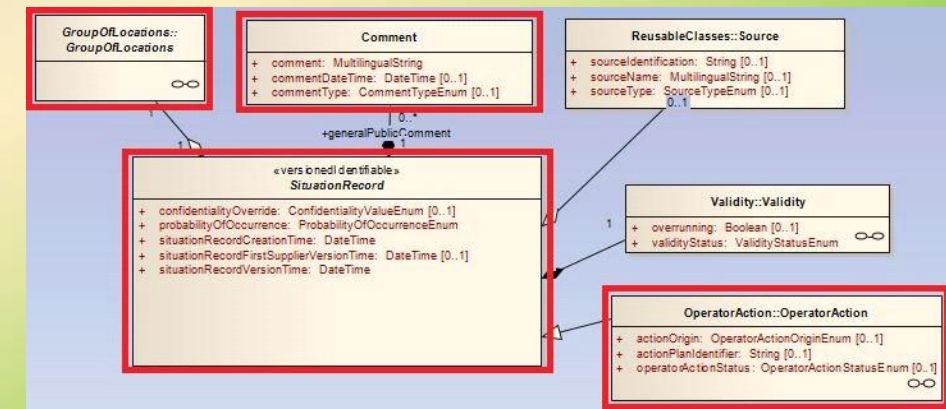

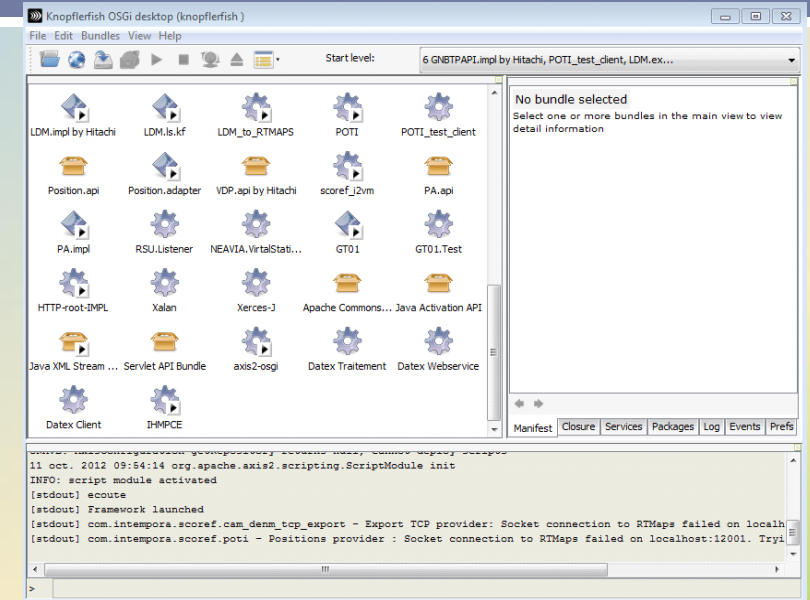

Datex Processing: can read the line from the Datex II message, extract the useful information and create new object for storage.

Datex Client: can pull informations messages from the Road Management Center and send traffic data messages gathered by RSU to the Management center.

Specification of the Datex II Gateway

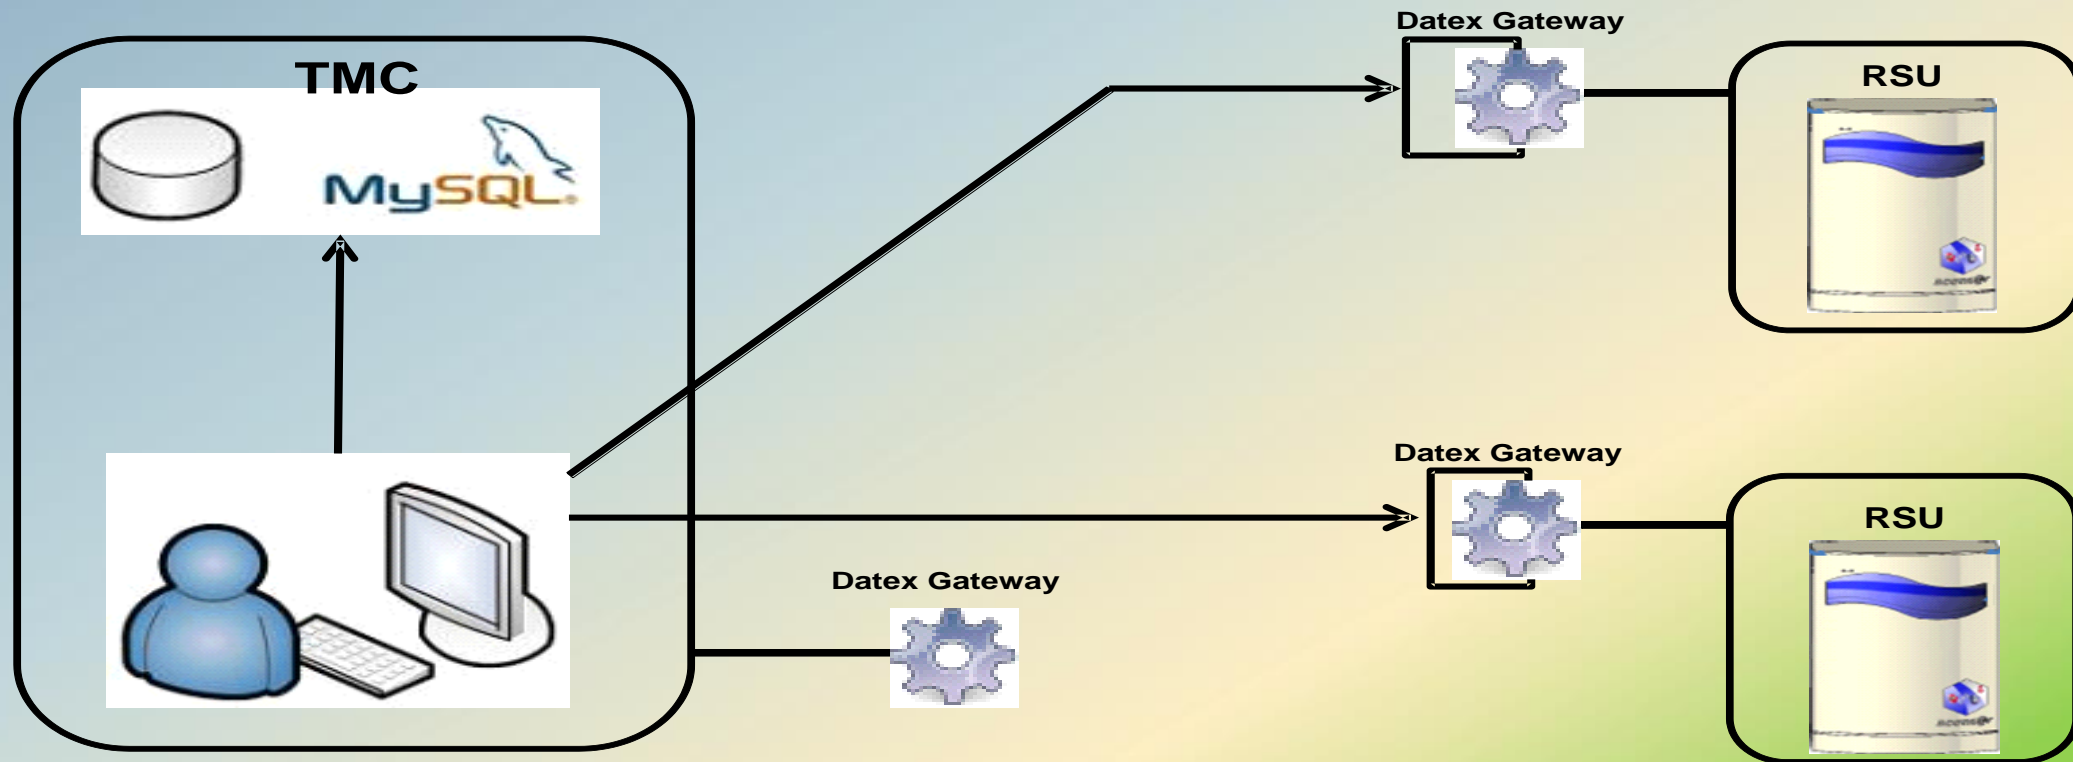

Developped as a Webservice
Deployed in the RSU, in a OSGI
environment
Communication with the SOAP protocol
Messages defined for each use case
from the Data model in Datex II

Push Mode – Center to RSU

Push Mode – RSU to TMC

11

Full scale tests

Various tested environments

- Closed track in Satory : to validate the system and Road Safety use cases.
- Motorway (A10, A86)
- Suburban roads (RD91)
- Urban roads (Versailles)

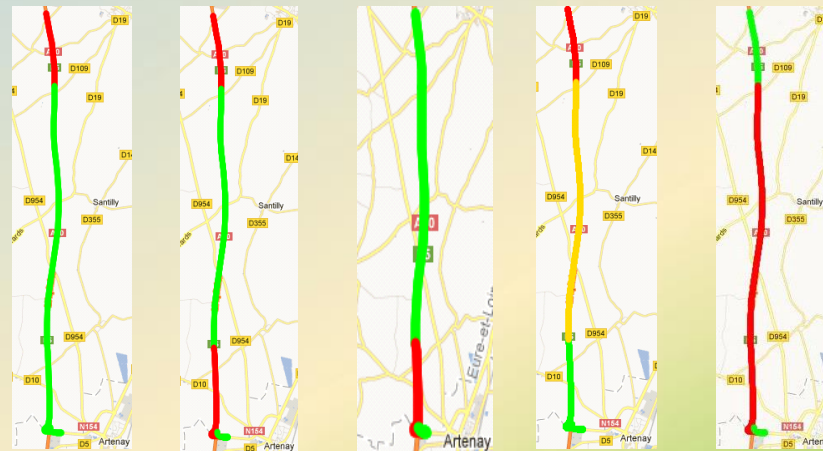

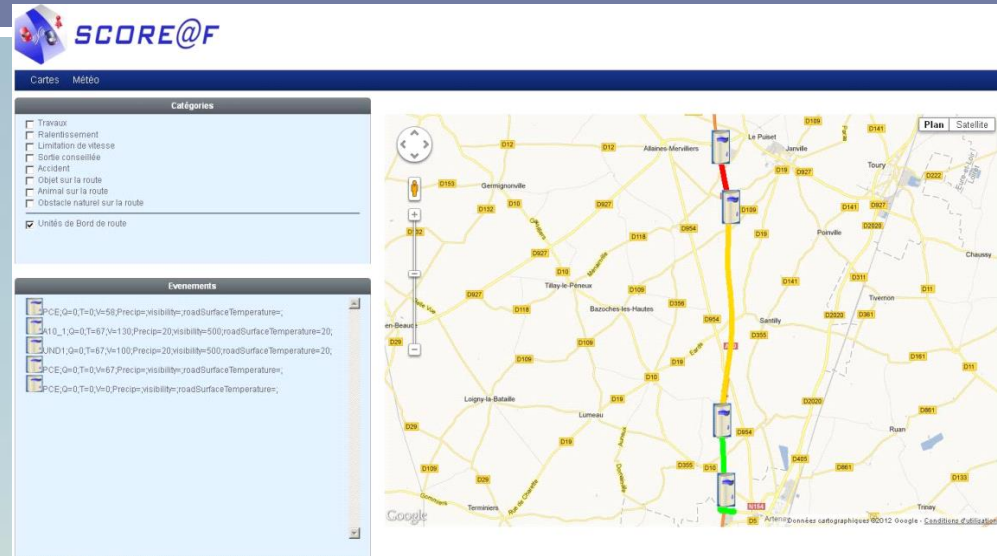

The three last environments were used to test the others uses cases (Traffic management, mobility and comfort)

Use case « Traffic information management » in Datex II

- Tests on open road : 13 km, 2x3 lanes, with a rest area in each way.
- Important traffic 50000 vehicles by day
- 4 RSU
- 8 uses cases tested
- Selected soluntaries to test the system
- Interview with an ergonomist for system improvement

RSU to RMC by the gateway :

- Speeds
- Number of vehicles
- Number of vehicles using the fog lights, the windshield wipers...
- Visibility, Weather

Informations stocked in the RMC's database

Real time evolution on the RMC's HMI

Not only a HMI but also an OBU

Score@f Navigation

The diagram illustrates the Score@f Navigation system. It features a central 3D cube with blue and white faces. On the left face, a red car is shown with wireless signal waves. On the right face, a blue car is shown with wireless signal waves. A red location pin is visible on the top face of the cube. Below the cube are two white rounded rectangular boxes. The left box contains an icon of a silver car and the text 'Mode Usager'. The right box contains an icon of a traffic light and the text 'Mode Gestionnaire'. At the bottom left of the diagram is a small logo with the French flag and the text 'Ministère de l'Équipement, des Transports et de l'Énergie'. At the bottom right is the logo for 'IFS STAR'.

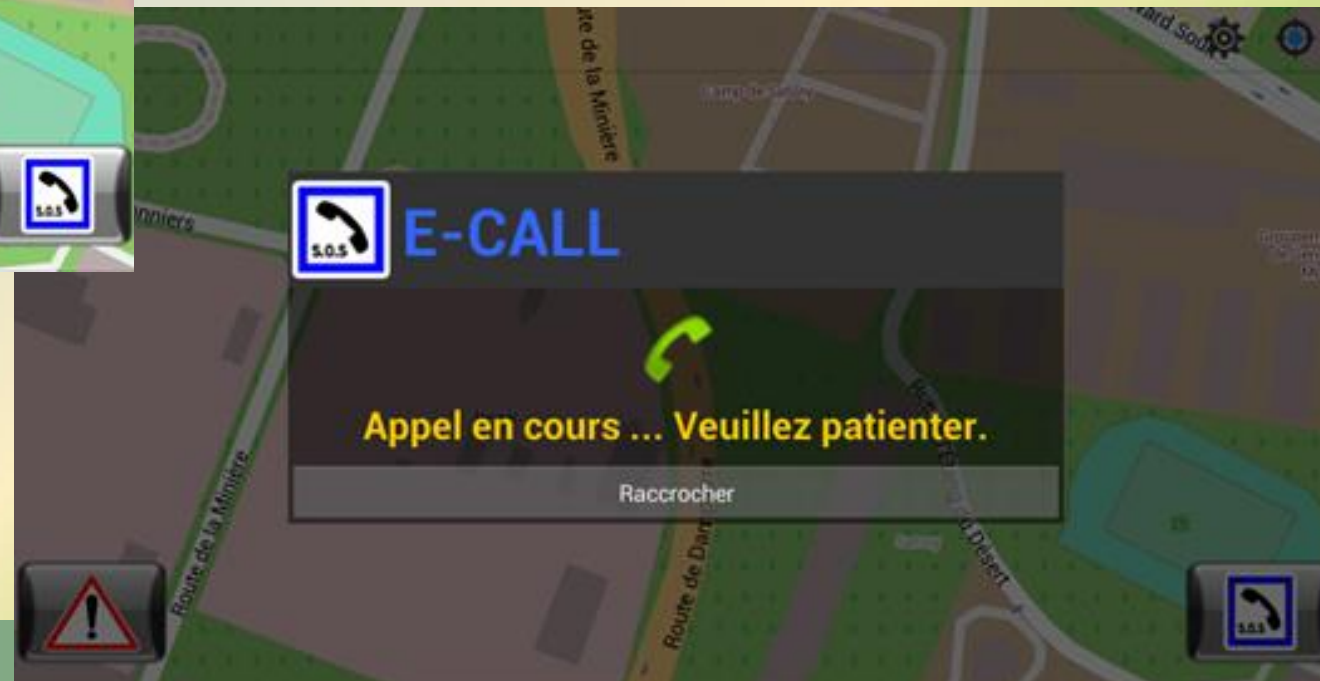

Mode Usager

Mode Gestionnaire

Développé par TA Van-Bao et BESNIER Joëlle

Joint Development – CEREMA/DTerIDF and IFSTTAR/LIVIC

HMI for drivers

Events Alerts / Contextual speeds

Road Work Warning : 20 seconds before the event's localization

Speeds : 10 to 15 seconds before the road sign

Onboard VMS

HMI for road managers

The patrol vehicle can send certified messages, VMS or Alert Road Safety

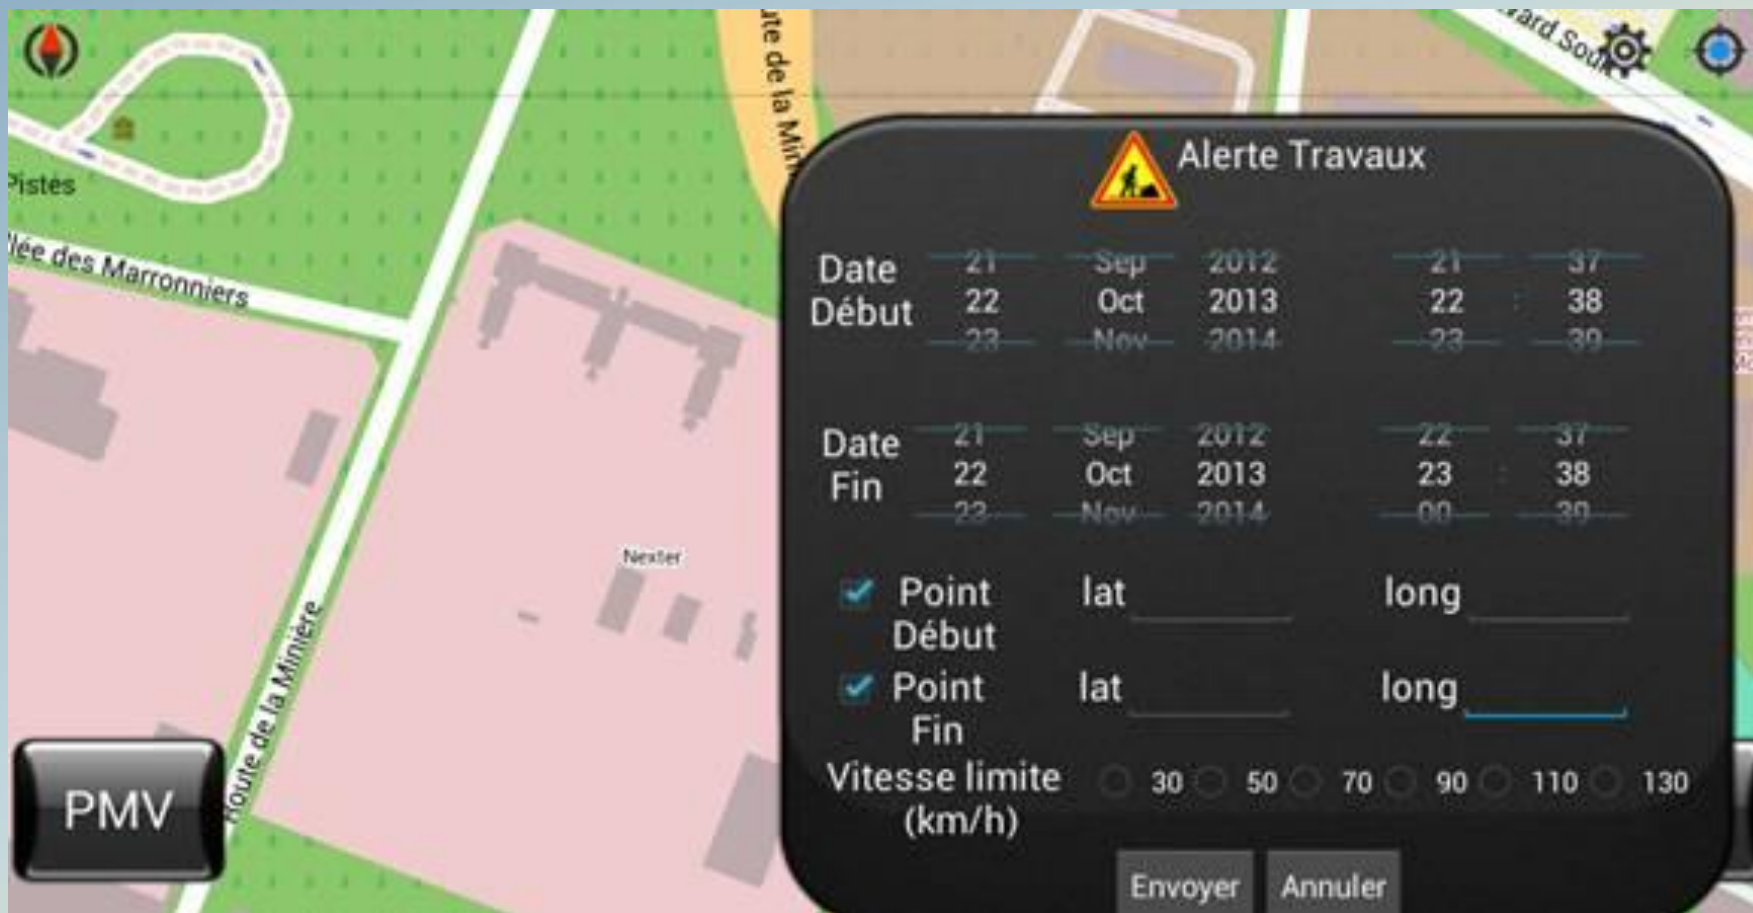

Sent directly to the RSU and TMC in DATEX II

by G5 or by 3G if not within range of RSU

Alert notification and VMS sent directly to road's users in CAM/DENM format

Road safety alert

Date :

- Begin
- End

Point :

- Begin
- End

Contextual Speed limit

Project Results

- Validation of standard technical platform
- Engineering process refinement
- Viable business model
- Societal benefits assessment

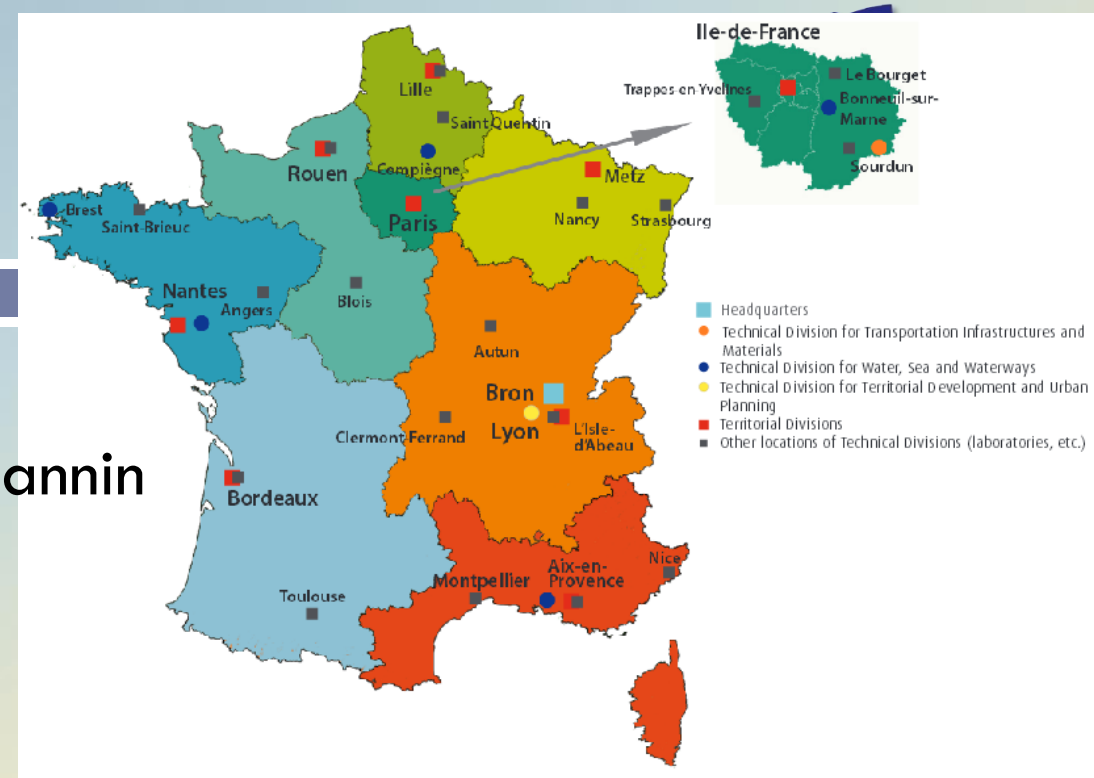

And after that...

SCOOP@F : Experimental deployment of 3000 Intelligent Vehicles over 2000 km of connected roads connected.

Appendix

□ Centre For Studies and Expertise on Risks, Environment, Mobility, and Urban and Country planning
(*Centre d'études et d'expertise sur les risques, l'environnement, la mobilité et l'aménagement*)

□ Our key figures

- 3100 employees
- 220 national and international experts
- € 250 M budget
- 29 sites in France
- 180 annual publications
- 66 national expertise hubs
- 33 associated research teams

- The Territorial Division of Greater Paris Region is part of the RST, Scientific and Technical Network of the **French Ministry of sustainable Development and Transports**
- In the field of Transports, the Territorial Division manages in particular the **Cluster of Competence and Innovation** about the Dynamic Regulation of Transport Networks.
- We are involved in standardization bodies (C-ITS and DATEX II) and in several French ITS or C-ITS projects : SCORE@F, SCOOP@F, JACINT
